Invention This invention relates to an optical system for endoscopes. 2.

Description of the Prior Art In recent years, endoscopes are widely used for examining the inside of a human body and are applied for endoscopic surgery. An optical system used in an endoscope is required to have a high resolution, a large field angle and a wide view angle, and the length of the endoscope should be as short as possible for examination of a deeper part of a body. However, the resolution and the field angle are mutually contradictory and the field angle of an optical system is proportional to its length. Accordingly, a technique has been required which allows one to satisfy the three requirements mentioned above. The optical

systems for endoscopes hitherto known are roughly classified into the following two types, a first type being a composite optical system composed of an imaging system and a beam guiding optical system, and a second type being a single optical system composed of an imaging system alone. In a first type composite optical system, a first element of a lens group and a second element of a lens group each having a positive refractivity are arranged to be nearer to an object side, a third element and a fourth element each having a negative refractivity are arranged to be nearer to an image side and the first element and the second element are offset from each other, and the third element and the fourth element are offset
